Subject: RE: Smoke/pressure test and Sewer Addendum to WP results?

Brad is correct concerning the possibility of VOCs related to any sewer lining. Depending upon the method in use, VOCs associated with cleaning, bonding, and curing of fiberglass/epoxy materials may be in use by the contractor.

Carolyn

Attached are the draft results for the supplemental sewer gas sampling activities and map displaying the sampling locations. As you can see, the analytical data appears to be variable between sampling events and may be related to temporal variations or other factors. Also, please note that although the southernmost manhole (MH #240020) exhibited the highest VOC concentrations, there were numerous samples obtained further upstream (i.e. closer to the Former Amphenol site) from this manhole that were less than the applicable screening levels, which strongly suggests that the VOCs detected in MH #240020 are not associated with the Former Amphenol facility. I also know for sure that the city was conducting a sewer lining project in the Adams Street neighborhood at the time of the sampling so this may have affected the results of the sampling activities.

Please contact us with questions or if you need anything else.

Sincerely,

Hi –
 Do you have any updates from the smoke tests and the additional five manhole investigations?
 Thanks.
 Carolyn
